**Supplementary Figure S1.** Recombination patterns and parental origin in 1.2 kb *pol* region of 17 sample from 535 IDUs in Guangxi, China. The genome map of the *pol* gene DNA sequence of 17 recombinant sample was generated using the Online Recombinant HIV-1 Drawing Tool ([https://www.hiv.lanl.gov/content/sequence/DRAW\\_CRF\\_recom\\_mapper.html](https://www.hiv.lanl.gov/content/sequence/DRAW_CRF_recom_mapper.html)).

**Supplementary Figure S2.** This figure illustrated time-scaled phylogeographic history of three HIV-1 subtypes (CRF01\_AE, CRF08\_BC, CRF07\_BC) for IDU in Guangxi. Background colours around branches represented the most probable origin province of the parental node of each branch. The names of the origin provinces were indicated by the colour of the legend in the upper left corner. The values of probability inferred by Bayesian skygrid demographic model estimation for the most probable ancestral location were specified at the corresponding nodes. The probable time of introduction for these three key subtypes with an effective population size circulating in Guangxi IDU was indicated at key nodes. Red and blue dots at the ends of branches denoted the sequences of study participants and references, respectively. The Bayesian MCC trees were visualised through the FigTree software v1.4.3 (<http://beast.bio.ed.ac.uk>). The figure editing was using Adobe Illustrator 2020 (V 24.0.1.341).

**Supplementary Figure S3.** This figure illustrated HIV transmission risk category link of three HIV-1 subtypes (CRF01\_AE, CRF07\_BC, CRF08\_BC) for IDU in Guangxi. The transmission risk category of the strains is color-coded as shown in the inset. Red and blue dots at the ends of branches denoted sequences of study participants and references, respectively. Background colors around branches represent the most probable origin of the parental node of each branch. The Bayesian MCC trees were visualized through the FigTree software v1.4.3 (<http://beast.bio.ed.ac.uk>). The figure editing was using Adobe Illustrator 2020 (V 24.0.1.341).
